/Weilu Super	n Lo/ visory Patent Examiner, Art Unit 2179		

Continuation of 11. does NOT place the application in condition for allowance because: Applicant has not attempted to amend the current claim language. After careful review of the claims (given the broadest interpretation) and the remarks provided by the Applicant along with the cited reference(s) the Examiner does not agree with the Applicant wherein that Dang provides a determination when the user is interacting with the system, in such a determination is present in order for the system to render the desired information. Dang shows that there are bond and unbound applets (as admitted by Applicant) and when the user navigates to another site the applets are determined to be unbound to keep executing while the user opens new applets that are bound (col.4). This specific interaction and processing of unbound versus bound is a clear indication of the system processing the user request for information thus there exists a determination within the system. Dang shows a system that can keep track of and execute a plurality of applets and the system makes a determination of what state a current applet is in and whether that applet is either bound or unbound at a given time when the user navigates through the interface. Dang's system uses a Frame class to manage all of the applets a user is currently executing on a system, thus Dang provides a system wherein initiated applets have a classification (whether or not an applet is within a frame and whether to have an associated window classes; col.3-4).
